Forum „Identity and Security
Management“

- In partnership with CONET
Solutions GmbH
- Moderated by
Frank Oster, CISM
E-Mail: foster@conet.de
- Participation free of charge for
everyone
- Register by e-mail to
forum@cast-forum.de

Key Topics:

- Identity Management
- Information Security
- Compliance
- Centralized Identity
Management Systems

Advantages of modern Identity Management:

- A unified view of all relevant
identities within a company
- Management & synchronization
of passwords, as a basis for
Single Sign On
- Reduced costs of
administration
- “Zero Day” provisioning and
de-provisioning.
- Provision of self-service
functionality e.g. for password
management and maintenance
of profile data
- Provisioning of roles via
request and approval
workflows

The Competence Center for Applied Security Technology e.V. (CAST e.V.) provides a wide range of services in the field of Information Security and is also a trusted partner for IT Security related questions. With its competent pool of resources, CAST provides educational assistance for those interested in IT Security – for specialization in IT Security at the University of Darmstadt or in taking up an internship. CAST also provides seminars, consultancy, workshops and tutorials for its users allowing them to make informed IT Security decisions.

The goal of CAST e.V. is to provide and develop the necessary competencies for the growing importance of IT security in all branches of business and public administration.

Identity and Security Management

In partnership with CONET Solutions GmbH, CAST e.V. now provides an information and discussion forum for "Identity and Security Management".

The primary focus of the forum is Identity Management and the role it plays in Information Security. Additional topics such as Compliance in relation to enforced standards, both internal and external are also addressed.

A central and company-wide **Identity Management System**, which includes components such as Roles and Processes, is fundamental for any modern IT infrastructure.

Modern organizations need a safe and secure method to be able to expand their business flexibly and fast, while at the same time maintaining control over all the different ways of access and safeguarding the data and resources they have made available.

It is here where modern **Identity Management Services** with its role-based provisioning of resources and the use of

Identity-Federation helps link organizations and provides an important foundation in building a secure infrastructure.

The aim here is to go beyond cost saving and attaining efficiency. By automating and centralizing identities, the idea is to lay a foundation stone for an Internal Control System (ICS).

The result is a solid, manageable and scalable management system whose capacity goes far beyond the (fast) disappearing boundaries of a data center. The combination of increased cost efficiency and improved flexibility, in conjunction with control and governance within the core business processes meets today's requirements for security and compliance by keeping the operational risk of a company to a minimum, thus ensuring a secured future.
